Selective breeding is in vogue since centuries to improve horse' breed. It aims at production of horses with special performance and bodily characteristics. It is a complex, costly and time-consuming occupation. But the characteristics of horses depends upon market demands. Many a times a horse, which possesses planned kineto, behavior, exterior characteristics, is not in demand anymore. For many years we performed horse "homeopathic correction" studies at 'Griffon' Stud Farm and Horse Club on the basis of A.A. Komissarenko's theoretical developments. We have established that not only physical characteristics of studs are inherited, but also their psychic traits, which fit into a certain constitutional type of the stud. Among such different types it is possible to identify both harmonious and disharmonious type of animals. It has been established the homeopathic remedy regimen depends on the age of an animal. In our experience, efficient homeopathic correction should be performed once in three months during the entire life-time of a horse, to maintain their bodily and psychic characters.

It is advisable to differentiate the constitutional characteristics of growing horses before fence training, as it may make it easier for the horse to grow and mature. In this case young horses attain good standard, have good height and psychic and physical characteristics.

At the farm we performed homeopathic correction of pregnant animals once in the eight month of pregnancy that is at three months before colt delivery. Four colts were born, which were rated as top grade on the zootechnic scale of All-Russia's Horse-breeding Research Institute (VNIKB). The evaluation is based on the animal activity at different times, during the first three years of the life.

In our observation, colts born after homeopathic correction in the pregnancy period present better exterior and behavioural characteristics than others in their ancestor line.

The outcome of our research is the conclusion that in horse breeding it makes sense to have early homeopathic correction. It improves animal's performance, the rapport between horses and men and ensures horse's career success.

Achievements in production of impeccable growing horses were highly appreciated by Trakehner Union in Russia, and the Griffon Stud Farm became a full-fledged member of the Union in 2015.
