## **Different Perspectives of Homeopathic Research Seal the Year 2021**

In this last 2021 issue, five articles are published concerning different aspects of homeopathic research, from a review of clinical studies on Polycystic Ovarian Syndrome and the therapeutic potential of homeopathy to treat these cases (Dewan et al., 2021) to a detailed systematic analysis of nanoparticles suspended in homeopathic preparations (Van Wassenhoven et al., 2021). In between, some interesting reports can also be found, as a case report about the successful treatment of a rectum prolapse in a kitten in a period of a few days with no need of surgery (Makker and Arora, 2021); an opinion article (update article) reported the necessity to develop clinical studies on homeoprophylaxy of Covid-19 in which the key aspects of immunocompetence could be evaluated, such as the serum levels of cytokines, mainly those related to the systemic inflammatory syndrome such as IL-6, and of neutralizing IgG and IgM (Patil, 2021); and an original article about the physicochemical properties of a Covid-19 nosode, in which different patterns were described using spectrophotometric methods, resulting in an electronic signature of each potency (Kumar Singh et al., 2021).

Enjoy the reading and happy 2022 for us all!
